Review queue Scans How pairs are matched Checks & limits

Scans / scn_2e990e8883589fb7 / Statistics TRIPWIRE ×2 Names and addresses are never shown

External publication is blocked on this scan. The uncited-dimension placebo failed its gate, so the findings are usable for internal review and disposition only. The primary control must pass, not absence of failure.
Tripwire `not_supported_rate` below_lower at 0.009369 against 0.01.
Tripwire `matched_fraction` above_upper at 0.910608 against 0.6.
This scan ran without a pre-registration lock, so it is labelled **exploratory** and every finding on it says so.

24 candidate pairs · 23 eligible · 1 below power floor

P-values and scan-level z

The plot shows the stored within-cell rank p-value for each candidate, in queue order. These are descriptive per-pair ranks, not individual significance tests. The z chart below is the single pooled scan-level test; no per-case z-scores are computed.

WITHIN-CELL RANK P-VALUES · 24 CASES

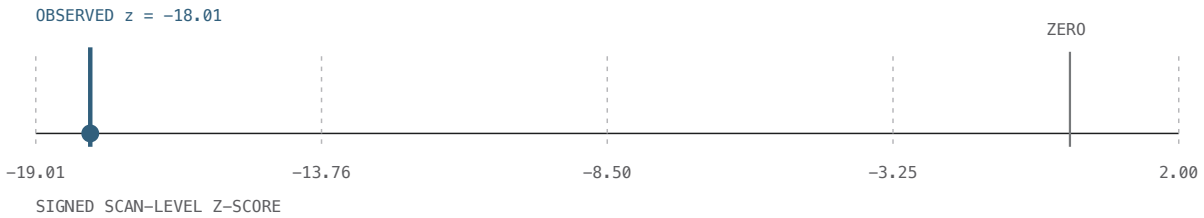

Lower values mean the denied record sits nearer the worse-ranked end of its own comparison cell. They do not establish case-level significance after multiplicity or the cell-power gate.

QUEUE #	CASE	WITHIN-CELL RANK	RANK P	POWER STATUS
1	0325e5f4	82.0	0.573333	Eligible
2	9dee5db8	34.0	0.660377	Eligible
3	9cfb6c1d	28.0	0.674419	Eligible
4	bdba2c65	48.5	0.724638	Eligible
5	217740e0	92.0	0.75	Eligible
6	143ce602	21.5	0.8	Eligible
7	ed43a9ec	2.0	0.5	Not enough for significance
8	1c2d616a	33.0	0.607143	Eligible

24	4b4b0602	51.0	0.836066	Eligible

POOLED SCAN-LEVEL TEST

Positive values are the direction the stated reasons would be harder to justify; negative values point the other way. This is one pooled test across matched cells, not a z-score for each case.

The observed statistic is negative, opposite the tested direction. The stored one-sided p-value is 1.0.

STORED TEST VALUES

z-score	**−18.0085**
one-sided p-value	**1.0**
matched cells used	**522**
adequate candidate cells	**23**
below power floor	**1**
